Ever wondered what's in the dust in your home?

DustSafe is a global study exploring household dust. Dust is a source of contamination in our environment. It contains a variety of pollutants like metals and plastics. Microbes, most of which are beneficial or benign, also live in the dust found in our homes. Our tiny friends routinely share spaces with us and can be found on virtually every indoor surface, our pets, our food and even our own bodies!

Sign up online and be a part of a global community of citizens helping scientists better understand dust.

Spring clean your home today and send us a sample!
